INTRODUCTION

The term intracranial aneurysm is used to describe the dilations or weak points in the walls of arterial blood vessels. Because of the weaknesses in the vessel walls, there is an increased risk of tears in the blood vessels, or 'ruptures', of the arteries supplying the blood to the brain. This causes bleeding on the surface of the brain and/or in the brain – a life-threatening condition for the patient concerned. It is therefore vital to be able to recognise and seal off aneurysms that are at risk of rupture. The closure of aneurysms, on an acute or preventive basis, in interventional neuroradiology is performed using minimally invasive, endovascular techniques.

This training course is aimed at neuroradiologists, who want to improve their skills in the endovascular treatment of aneurysms.

In addition to the basics of aneurysm treatment, participants will experience the haptics, delivery and deployment of the ACCERO® Stent, hands-on training and live cases.

AGENDA

Day 1

Monday, 04 May 2020
Hotel Franz

<table>
<thead>
<tr>
